

HABITAT AREA 2

Remediation Overview

Public safety is an important priority during remediation and restoration of Habitat Area 2 (HA-2). For example, use of designated and clearly marked work zones and truck routes are designed to reduce the project's footprint and help minimize disruption to the local area. Safe access to Harbor Front Industrial Park, the Bay Trail, and other nearby areas remain open during the project. To learn more, visit: www.campusbayforward.com

Staging Areas

are construction support areas connected to the HA-2 work zone. Staging areas are needed for sediment and soil material handling and other activities. For example, a temporary wastewater treatment system will be located here to capture and treat construction related water. Stormwater in HA-2 and the lagoons will be captured and treated as needed to fully comply with all discharge permits.

Traffic Safety includes use of flaggers and signs at key places and times.

Designated Truck Route

is an important safety feature of the project, controlling where and how trucks and other construction vehicles enter and leave the area. I-580 (at Regatta Blvd.) is the primary transport route for all materials, with access to and from the staging areas via Meade Street, South 47th Street, and East Montgomery Avenue.

Work Zone

includes the upper and lower lagoons/ponds, berms, and adjacent upland area (all included here in dark green color). Heavy equipment is used to remove sediment and soil, and temporary fencing and signage mark active work zones.

Uplands Lot 3
Additional remediation of Uplands Lots 1, 2, and 3 is pending DTSC approval of a final remedy.

Staging Area

Upper Lagoon

Lower Lagoon

Bay Trail

and the trail access connector from South 51st Street remain open during the work. Both trails are a safe distance away from active construction areas.
